#### Summary

This text provides a summary of trends of selected risk indicators and supervisory reporting data as of Q4 2019. As such, it does not reflect the impact from the COVID-19 pandemic. This includes that reported capital ratios do not fully reflect decisions to suspend dividends or other types of distributions recently taken by banks as a follow-up to competent authorities' statements and recommendations.

**EU banks' capital ratios increased in Q4 2019.** The CET1 ratio reached 14.8% on a fully loaded basis, up from 14.4% in Q3 2019. This trend was supported by higher capital, but also contracting risk exposure amounts (REA). The latter came in parallel to declines in total assets as well as total loans and advances. Similar to the capital ratios, the leverage ratio increased, driven by rising capital and declining exposures. It reached 5.5% on a fully loaded basis, which is 30bps higher than in the former quarter.

Asset quality improved further. The ratio of non-performing loans (NPLs) further declined from 2.9% to 2.7% in Q4 2019, continuing a trend of small contractions similarly seen in the last three quarters. However, in contrast to the former quarter, the NPL ratio contracted even though its denominator (total loans and advances) declined. The coverage of NPLs improved slightly from 44.6% to 44.7%. Similar to the NPL ratio, IFRS 9 related figures showed an improvement in asset quality. The share of stage 2 assets declined from 6.9% to 6.8%, and the share of stage 3 assets from 3.3% to 3.1%.

**Return on equity (RoE) worsened.** Banks' RoE declined by 80bps in Q4 to 5.8%, well below EU/EEA banks' average cost of equity. Banks' cost to income ratio increased from 63.3% in Q3 to 64% as of year-end 2019. Even though it seems to be a seasonal effect, this fourth quarterly growth was the lowest since 2014. The net interest margin slightly widened from 1.43% to 1.45%. Such an increase is also a seasonal effect in the fourth quarter and does not necessarily indicate a reversal of the general trend in low margins. Costs of risk slightly widened by 3bps to 48bps.

**EU banks' loan to deposit ratio further contracted.** The loan-to-deposit ratio for households and non-financial corporations declined by 120bps to 114.8%. The asset encumbrance ratio did again not show any significant change, similar to the quarters before, standing at 27.3% (compared to 27.5% in Q3 2019). The liquidity coverage ratio increased from 147.9% to 149.9%.

\*) This risk dashboard is based on a sample of Risk Indicators (RI) from 182 European banks (unconsolidated number of banks, including 35 subsidiaries). The sample of banks is reviewed annually by competent authorities and adjusted accordingly. This can determine breaks in the time series. Ratios provided in the text are weighted average if not otherwise stated. The data is based on the EBA's implementing technical standards (ITS) on supervisory reporting (EU Regulation No 680/2014 and it subsequent amendments). In the chart on Risk Indicators by size class, considering the distribution of the average total assets, the small banks are those below the first quartile, the large banks are those above the third quartile. Underlying data in this risk dashboard has been compiled by the EBA since 2014 and it has served as basis for additional analyses included in EBA's Risk Assessment Report, last version published in November 2019.

#### Overview of the main risks and vulnerabilities in the EU banking sector

NPL reduction continued at a slow pace in Q4 2019, but deteriorating economic conditions can have an increasing impact on banks' asset quality. Given that some banks have increased their exposure towards riskier lending segments, and competition for new lending was strong and pricing tight, there are some doubts as to whether all risks were adequately priced. Cost of risk has increased.

Short-term outlook: The COVID-19 pandemic has led to sudden supply- and demand shocks and deteriorating economic prospects, with the expectation of rising default rates and higher provisioning needs. The worsening financial position of corporates and households, in particular in highly indebted countries, might affect existing loan portfolios and efforts to manage NPLs. Banks' focus on riskier lending categories over the past few years might contribute to additional future defaults. Banks might focus on managing existing credit lines of potentially distressed borrowers rather than extending new lending. Extensive monetary and fiscal stimulus programmes as well as policy responses such as guidance on debt moratoria might provide some relief to tightening financing conditions. Latest oil price trends might put additional strains on banks and result in rising default rates of commodity-related exposures.

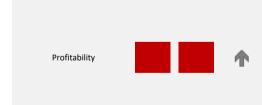

Most asset categories performed relatively strong on financial markets until February, volatility was mostly contained, and bond spreads tightened amid optimism about receding global trade tension and a very accommodative monetary policy stance. Prices for some asset categories appeared overvalued given some weakening in fundamentals, which may have aggravated sharp repricing of assets and bouts of high volatility across financial markets since the COVID-19 outbreak. In early March, volatility on financial markets was highest since the financial crisis.

Short-term outlook: Further market price corrections and bouts of volatility might follow as the progression of the COVID-19 pandemic and its economic impact are highly uncertain. More volatile financial market can be expected to be susceptible to further underlying geopolitical risks (e.g. Mid-East tension, tensions between the EU and Tuyer, trade tensions) and commodity price corrections, in particular of oil, even if policy and fiscal measures to contain the COVID-19 pandemic and to limit its economic implications would show some success. Beyond Europe and the COVID-19 pandemic, interventions of the US-Fed to mitigate bouts of volatility in USD repo and financial markets point to additional persisting underlying risks, and the potential for sudden volatility and illiquidity.

Favourable funding conditions in Q4 2019 further improved until February and led to historically high issuance volumes of unsecured instruments, in particular of MREL/TIAC eligible bonds. Banks made use of these conditions to pre-fund some of their 2020 funding needs at the lowest pricing levels recorded and amid very strong investor demand. Yet conditions suddenly changed fundamentally with the COVID-19 outbreak in Europe. Spreads increased strongly, volatility spiked, and meaningful bank market funding activity came to a halt. Some challenges to attain short-term FX liquidity, in particular USD, were also noted. In contrast to wholesale funding markets, banks' deposit base remained resilient.

Short-term outlook: Banks have no immediate longer-term funding needs as they frontloaded parts of their 2020 funding needs in very benign market conditions until February. Ample central bank liquidity facilities, including additional longer-term funding programmes and extended USD swap lines central banks launched in Europe and beyond in response to the COVID-19 outbreak, can moreover act as strong backstops. Some challenges for banks to attain longer-term market funding at reasonable costs can be expected while high uncertainties surrounding the COVID-19 pandemic persist and markets stay volatile. Vulnerabilities for liquidity positions and potentially the deposit base of banks particularly affected by deteriorating market- and economic conditions may also arise.

Profitability was further reduced in Q4 2019 and is well below the estimated cost of equity for many banks. Very accommodative monetary policy continued to exert downward pressure on market interest rates and interest margins. Strong competition forced banks to lower their loan prices, while they find some limitations to further reduce their funding costs, e.g. by some limitations to pass on low and negative rates to client deposits. Increasing operational costs, including high ICT investment needs and high governance- and compliance costs, offset ongoing efforts to reduce expenses, e.g. by staff- and branch reductions. Increasing cost of risk is further adding pressure on profitability.

Short-term outlook: The COVID-19 pandemic has led to supply- and demand shocks that are expected to weigh on economic growth and further add to substantial bank profitability challenges. Loan growth might stall and thus affect interest income, while additional monetary stimulus might add further pressure on margins. Fee income might be affected by declining transaction volumes and reduced asset management fees, and also by investment fund outflows. The prospect of higher provisioning and impairment needs may further affect profitability. The fiscal response of governments, but also supervisory measures to mitigate the impact of the Covid-19 pandemic and pragmatism in the application of the prudential framework may offer some relief to the challenges banks are facing.

The COVID-19 pandemic with its challenges for business continuity and operational resilience, including susceptibility to cyber-attacks, adds to previously existing operational challenges. Measures to constrain the pandemic may further increase the reliance on and vulnerabilities of ICT systems. They add to challenges of previously existing risks to cyber security, of data breaches, and of reliance on third party providers. Potential challenges to governance structures stemming from AML/CFT risks also remain relevant. Contingency measures applied amid the COVID-19 pandemic need to demonstrate their effectiveness. Supervisors have taken steps to alleviate the operational burden on banks, such as postponing the 2020 EU-wide stress test and extending remittance dates for reporting data.

The level of risk and short-term outlook summarise, in a judgmental fashion, the probability of the materialisation of the risk factors and the likely impact on banks. The assessment takes into consideration the evolution of market and prudential indicators, National Supervisory Authorities' and banks' own assessments as well as analysts' views. The short term outlook refers to a six months period.

Individual country data includes subsidiaries, which are excluded from EU aggregate. For example, at country level the subsidiary in country X of a bank domiciled in country Y is included both in data for countries X and Y (for the latter as part of the consolidated entity). In the EU aggregate, only the consolidated entity domiciled in country Y is considered. The sample of banks is unbalanced and reviewed annually.

Individual country data includes subsidiaries, which are excluded from EU aggregate. For example, at country level the subsidiary in country X of a bank domiciled in country Y is included both in data for countries X and Y (for the latter as part of the consolidated entity). In the EU aggregate, only the consolidated entity domiciled in country Y is considered. The sample of banks is unbalanced and reviewed annually.

(1) Gross carrying amounts, other than held for trading.

#### **Exposures to Real Estate activities and Construction**

In compliance with the Recommendation ESRB/2016/14 on closing real estate data gaps, the EBA is disclosing aggregated information on the exposures towards Non-financial corporations under Real Estate activities (NACE code L) and Construction Sector (NACE code F) (1)(2)

(1) In disclosing aggregated information on the real estate (RE) exposures towards the different national RE markets in the Union, the EBA made use of information in regulatory reporting templates that provide a breakdown of credit exposures. RE exposures are identified as those referred to as both the NACE codes 'F' and 'L', although strictly speaking some sub-categories would need to be excluded following the Commercial Real Estate (CRE) definition adopted in the ESRB Recommendation.

individual country data includes subsidiaries, which are excluded from EU aggregate. For example, at country level the subsidiary in country X of a bank domiciled in country Y is included both in data for countries X and Y (for the latter as part of the consolidated entity). In the EU aggregate, only the consolidated entity domiciled in country Y is considered. The sample of banks is unbalanced and reviewed annually.

(1) The RoE is decomposed according to the formula: RoE = (NoP / Asset) \* (Asset / Equity) \* (EbT / NoP) \* (NP / EbT). In case of a negative EbT, the ratio NP / EbT is computed according to the formula (1 - ((EbT - NP) / ABS (EbT))) to maintain the sign of the tax effect. Therefore, the RoE decomposition adjusts to the following: RoE = (NoP / Asset) \* (Asset / Equity) \* (EbT / NoP) \* (1+ (1-(NP / EbT))).

## Methodological note on the Risk Indicators' (RIs) heatmap

The heatmap provides a quick overview of the main RIs, in which it is possible to find the category, number and designation of the specific RI, its historic development and the three buckets in which each data point is assigned to across time (green for the "best" bucket, yellow for the intermediary one and red for the "worst" bucket). The "sample of reporting banks" returns the actual number of banks that submitted the expected data for that reference date (consolidated view).

For each of the RIs' quarterly data, the distribution across the three buckets is computed in respect of the sum of total assets from all banks. Thus, if we observe any given bucket increasing its percentage, we immediately acknowledge that more assets are being assigned to that bucket. However, this does not necessarily mean that more banks are comprised within the bucket (the sum of total assets for all banks is fixed, as well as the total assets from each bank taken individually).

The traffic light of each RI can assume three colours (green, yellow and red) depending on the latest developments on the "worst" bucket of the RI comparing to the whole time series. If the "worst" bucket is progressing positively (i.e. in case fewer assets are being assigned to it), the traffic light should be moving away from red getting closer to green. The colour is computed considering the 33rd and the 67th percentile of the time series.

To help reading the heatmap, let us consider the example of the cost to income ratio:

The green traffic light for the ratio points to the good behaviour of this RI in the last quarter relating to past observations.

More than just declaring if the "worst" bucket has more or less percentage of assets assigned to it, this traffic light approach delivers simultaneously an insight to the latest developments in the RI's "worst" bucket and to the relative position of that data point comparing to all other observations in the same bucket.

The Risk Assessment (RA) meter summarizes the developments in all the KRIs included in the heatmap, providing a single measure. It is computed as the weighted average across the KRIs sum of total assets in the "intermediate" and "worst" bucket. The average is weighted in order to guarantee that each KRI category (solvency, credit risk and asset quality, earnings and balance sheet structure) receives the same weight. Since each category includes a different number of KRIs, the weight of each KRI is thus different. The risk perception increases with higher values of the RA meter: the closer to 100%, the higher the risk.

For more information regarding the Risk Indicators formulas, applicable to each reporting framework, please see the List and Methodological Guide available her (2) For the calculation of the average the previous December figure is used as an "anchor" for the subsequent year, and the second the number is taken from the latest quarter observation, i.e. Q1, Q2, Q3 or Q4.

<sup>(3)</sup> Applicable only to IFRS reporting banks. For nGAAP banks the formula is: Increases and other adjustments in allowances due to amounts set aside for estimated loan losses during the period (A) / Total gross loans and advances subject to impairment (B + C + D)

<sup>(4)</sup> Encumbered assets (recognised on the balance sheet) are considered at their carrying value, collateral received is considered as at fair value.
